Installation

Install Option: Freestanding

Place the amplifier on a flat horizontal surface.

1. Verify the surface is flat and level, and that the amplifier's power cord and connections will be safely out of the way to avoid snagging, yanking, or crushing.
2. Attach the 4 included adhesive feet to the bottom of the amplifier. The 4 feet should be attached near the 4 corners.
3. Place the amplifier on the surface.

Advance to the connect the amplifier procedure on page 12.

Install Option: Surface Mount

Secure the amplifier to a flat surface using the surface mount brackets.

1. Verify the surface is flat and level, and that the amplifier's power cord and connections will be safely out of the way to avoid snagging, yanking, or crushing.
2. Use the included screws to fasten the 4 surface mounting brackets to the 4 attachment points on the bottom of the amplifier.
3. Place the amplifier on the surface and fasten the mounting brackets to the surface.

Advance to the connect the amplifier procedure on page 12.

Install Option: A single amplifier in a 19-inch AV rack

Install a single amplifier by itself in an AV equipment rack using the included single-device mounting bracket and the device mounting bracket.

1. Verify the installation rack space meets the temperature and spacing requirements in the Installation Considerations section on page 2.
2. Attach the single-unit mounting bracket to the left or right side of the amplifier.
3. Attach the device mounting bracket to the opposite side of the amplifier.
4. Place the amplifier in the rack and use 2 of the included screws to secure the mounting plate to the rack.

Advance to the Connect the Amplifier procedure on page 12.

Option: Dual devices in a 19-inch rack

Install two amplifiers side by side in a standard AV rack using the device mounting bracket included with each unit and two of the included surface mounting brackets.

1. Verify the installation rack space meets the temperature and spacing requirements in the Installation Considerations section on page 2.
2. Place both amplifiers side by side on their tops, with the bottom facing up. You are about to fasten the amplifiers together for installation, so their front panels must face in the same direction.

3. Attach 2 of the surface mounting brackets to the bottom of the 2 amplifiers on the surface-mount attachment points where the amplifiers meet. Each bracket should cover the adjoining mount points on both amplifiers.

4. Fasten the included device mounting bracket to the left side of the amplifier it came with. Then fasten the included device mounting bracket to the right side of the second amplifier.

5. Place the linked amplifiers in the rack and secure them in place.

Advance to the Connect the Amplifier procedure on page 12.

Connect the Amplifier and Set the Hardware Settings

Connect the amplifier to the input and output devices in the AV systems as well as any voltage control and input / output logics. See the descriptions in this section for the port functions.

Adjust the mode settings and turn on the high pass filter if required for your system.

Connect the Input Devices to the Input Ports

Connect input AV devices requiring signal boosting to line and speaker voltage levels to the 3-pin input ports.

Pitch: 3.81mm

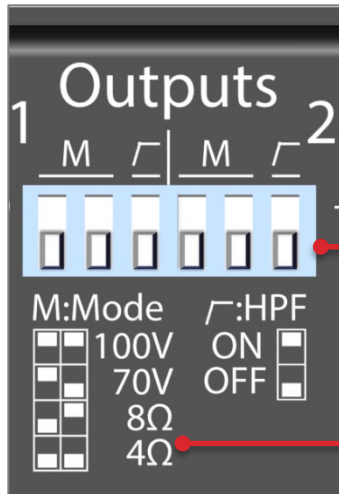

Adjust the Output Gain

The default gain setting for each output channel is 0 dB. This provides a sensitivity of 4 dBu in for rated program power. The gain can be adjusted from mute to +3 dB using the back panel dial control.

Limiter threshold: Increasing the gain over 0 dB also increases the limiter threshold for the channel. For example, +3 dB grants a doubled program power capacity on that channel.

Set the Output Mode and High Pass Filter

Switches: Each channel has 2 mode switches. These can be positioned in 4 combinations activating one of 4 output modes.

The HPF switch is placed in either the ON or Off position.

Switch position diagram

Mode switches (M)

The 4 modes modify the gain structure and limiter thresholds.

- **100 Volts** - use this mode if the channel will drive a constant voltage 100 V circuit with peak power up to twice the nominal power.
- **70 Volts** - use this mode if the channel will drive a constant voltage 70 V circuit with peak power up to twice the nominal power.
- **8 Ω (ohm)** – use this setting if the loudspeaker will drive an impedance greater than 6 ohm.*
- **4 Ω (ohm)** - use this setting if the loudspeaker will drive an impedance lower than 6 ohm.*

*If power exceeding the rated program power is required, boost the gain trim above 0 dB. See page 12.

The Tesira Design Software can further assist in optimizing the amplifier's outputs.

High pass filter switch (HPF)

- Adds 70Hz second-order high pass filtering when in the ON position.

Connections and Settings continued on the next page

Connect the Speakers to the Output Ports

Keep the following points in mind.

- To minimize power loss, use a speaker cable of appropriate gauge for the load impedance.
- Use the supplied euroblock plugs to connect loudspeaker outputs.
- If stranded speaker wire is used, be sure to incorporate all strands into the connector, as stray strands can short to the adjacent terminal or chassis.
- Do not leave excessive bare wire outside the terminals, as this can lead to shorts.

Optional: Connecting the Volume Control Inputs

Function: Output level adjustment. Provides 0V to 5V external volume control per input channel.

Pitch: 3.5mm

Type: 10kohm passive pot

Potential: These ports are not potential-free.

Optional: Connecting the Logic Inputs and Outputs (I/Os)

Pitch: 3.5mm

Pin Functions

Note – the pin functions are factory set.

- Pin 1 Input: Mute all
 - Active low
- Pin 2 Output: Health output
 - Fault exists if low
- Pin 3 Output: Sleep mode status
 - Unit asleep if low
- Pin 4 Input: Sleep mode
 - In sleep mode when low

Potential: These ports are not potential-free. External relays may be needed to prevent ground loops depending on the application.

Pin Data

- When activated, the I/O ports are tied to GND through a FET transistor.
 - Also known as an open drain or collector function.
- +5V reference limited to 150mA

Plug in the Amplifier

Always use the detachable power cord that came with the amplifier or an identical replacement.

1. Attach the power cord to the power receptacle on the back of the amplifier.
2. Plug the connected power cord into the wall power outlet.

Amplifier Setup

For amplifiers being installed in a Tesira-managed AV system.

Downloading Tesira Design Software

You will need a copy of the Tesira Design Software when integrating the amplifier into an AV system managed by a Tesira DSP device such as a Tesira Server or a TesiraFORTÉ. The software enables the setup of a loudspeaker processing block preceding the amplifier in the system and provides help on configuring the output mode switches and gain settings for the loudspeakers.

Voltera A amplifiers can also be installed in non-Tesira systems. You do not need a copy of the Tesira Design Software for this type of system setup.
